

How HashCase Protects Your Data & IP

Practical, Hardened Security for Your Custom AI Workflows

TARGET: Founders, CTOs & Ops Leaders
SCOPE: Data Storage, Privacy & Fine-Tuning
STANDARD: **Zero-Leakage Private Model Hosting**

The HashCase Security Commitment: When you build custom AI automations with HashCase, your business data is never shared, never leaked, and never used to benefit another company. We take leading open-source models and fine-tune them exclusively for your business. Your model weights and proprietary records are hosted in dedicated, isolated environments with closed network ports and banking-grade encryption from day one.

Our 4 Practical Security & Data Privacy Pillars

PILLAR 1: Private Open-Source Models: No Leaks, Total Ownership

Your Data Fine-Tunes Models That ONLY Your Company Uses

What We Do: Unlike typical agencies that send your raw customer and business records to public black-box APIs, we fine-tune high-performance open-source models (such as Meta's Llama 3, Mistral, or Qwen) specifically on your company's workflows. These fine-tuned model weights are deployed in dedicated, private containers. Your data is NEVER pooled, NEVER shared, and NEVER used to train models for anyone else. Your competitors will never benefit from your data, and your custom model intelligence remains 100% yours.

Client Guarantee: Zero data leakage, absolute model exclusivity, and 100% intellectual property ownership.

PILLAR 2: Hardened Storage Architecture: Unbreachable Cloud Infrastructure

Zero Public Exposure, Dedicated Databases & Banking-Grade Encryption

What We Do: We do not store your information in open buckets or expose databases to the internet. We deploy your storage inside an isolated Virtual Private Cloud (VPC) with all public database ports strictly closed—accessible only by authenticated, authorized application code. All data is protected with AES-256 encryption at rest (rendering disk data unreadable gibberish if physically compromised) and TLS/HTTPS encryption in transit. Furthermore, we enforce strict multi-tenant isolation: your data is never mixed with another client's records.

Client Guarantee: Closed-port network isolation, AES-256 encryption, and zero cross-company data co-mingling.

PILLAR 3: Ground-Level Operational Hygiene: Real Security in Practice

Strict Key Vaults, Least-Privilege Access & Prompt Injection Defenses

What We Do: Real security lives in everyday engineering discipline. We store all database credentials, API keys, and tokens in encrypted cloud secret managers (like AWS Secrets Manager)—never hardcoded in code. We enforce the Principle of Least Privilege: only the specific engineers directly building your pipeline have temporary access, protected by mandatory Multi-Factor Authentication (MFA). We also implement prompt injection and extraction firewalls so outside users cannot trick your AI into revealing internal system prompts, database keys, or private customer records.

Client Guarantee: No unauthorized staff browsing, zero exposed credentials, and hardened defenses against AI exploitation.

PILLAR 4: Business Continuity & Your Exit Freedom

Automated Daily Backups with a 100% Permanent Deletion Guarantee

What We Do: We protect your operations with automated daily encrypted backups of your databases and model checkpoints, ensuring a server crash or accidental deletion can never halt your business. Equally important is our exit policy: we never hold your data or models hostage. If our engagement ever concludes, all raw documents, fine-tuned weights, vector embeddings, and database snapshots are permanently wiped from our systems upon your request, with zero residual copies.

Client Guarantee: Continuous operational uptime with zero vendor lock-in and a verifiable, complete data deletion guarantee.

How HashCase Compares to Typical AI Agencies

Security Factor	Typical AI Agency / Off-The-Shelf Tools	The HashCase Standard
Model Hosting	Data sent to public third-party APIs (black-box)	Private open-source models hosted in dedicated containers
Model Ownership	You rent access; vendor owns the intelligence	You own the fine-tuned model and custom weights

Data Storage	Shared multi-tenant databases with open ports	Isolated VPC subnets, closed ports & strict tenant separation
Encryption	Basic or default settings, often incomplete	AES-256 at rest and TLS/HTTPS in transit everywhere
Competitor Risk	Risk of your data training general vendor models	Zero-leakage guarantee; your data is never pooled or shared
Access & Keys	Keys often hardcoded in scripts or shared drives	Encrypted secret vaults (AWS Secrets Manager) & MFA
Exit & Deletion	Proprietary lock-in with residual data retention	Complete data export or permanent cryptographic wipe

Built for Real Businesses. Protected by Real Engineering.

You don't need an unreadable 50-page corporate manual to know your data is safe. With HashCase, your data stays in your private environment, tunes your private models, and powers your business—with zero leaks, zero public sharing, and 100% data ownership.
